- Onboarding, Sign up, Sign in, Forgot & Reset Password, Advanced Account Setup, Help Center (FAQ & Contact Support), Profile, Settings, & More

Technologies used

- React Native

How to Start Helia?

To kickstart your Helia project, follow these step-by-step instructions:

1. Install the React Native CLI

- Open a terminal or command prompt.
- Execute the following command to install the React Native CLI globally:

```
npm install -g react-native-cli
```

2. Navigate to your Project Directory

- Open a terminal or command prompt.
- Use the `cd` command to navigate to the directory where your Helia project is stored.

3. Install Project Dependencies:

- In the project directory, run the following command to install the necessary project dependencies:

```
npm install
```

4. Start the Development Server

- Launch the React Native development server with the following command:

```
npx react-native start
```

5. Choose How to Run Your App:

- Once the development server is running, it will display relevant information.
- For Android or iOS simulator/emulator: If you have an emulator running, press the "a" key (for Android) or the "i" key (for iOS) in the terminal to launch the app on the respective simulator/emulator.

6. Test and Develop Your App:

- With your app running, you can make code changes and observe updates in the simulator/emulator or on your physical device.
- Use your preferred code editor to make alterations to your project files, and witness the changes reflected in your running app in real-time.

Project folder structure

- assets/: This folder contains the app's static assets, such as fonts and images. fonts/: Contains the font files used in the app. icons/: Contains the icons files used in the app. images/: Contains image assets used in the app.
- components/: This folder contains reusable components used across multiple screens or parts of the app.
- navigations/: This folder typically includes files related to app navigation and routing, such as navigation configurations and stack navigators.
- screens/: This folder holds the individual screens or pages of the app. Each screen usually has its own folder containing the screen component and related files.
    - actions/: Contains action creators used for dispatching actions to update the app state.
    - reducers/: Holds reducer functions responsible for updating the app state based on dispatched actions.
- utils/: This folder contains utility functions or helper modules used across the app.
- App.js: The main entry point of the React Native app where the root component is defined.
- package.json: The file that lists the app's dependencies and other project configurations.
- Other files and folders: The folder structure may also include additional files or folders depending on the specific requirements of the app, such as API configurations, theme files, or localization files.

How To Use Helia

Integrating Helia into your React Native project is a straightforward process.

- Import the necessary components and screens seamlessly.
- Establish intuitive navigation flows to guide users through different sections Customize UI elements to align with your branding and design preferences.
- Employ CLI commands for efficient management of event data and configurations.
